## Delta Marker Measurement for 2.4835 GHz Band Edge

Date: 23.SEP.2009 09:54:27

Measured Field Strength for High Channel in 1 MHz RBW/3 MHz VBW = 108.32 dB $\mu$ V/m

Delta Marker = -42.71 dB

Therefore, Peak Field Strength = 108.32 dB $\mu$ V/m - 42.71 dB = 65.61 dB $\mu$ V/m

Limit = 74 dB $\mu$ V/m

Average Field Strength = 65.61 dB $\mu$ V/m - 16 dB (Duty cycle factor) = 49.61 dB $\mu$ V/m

Limit = 54 dB $\mu$ V/m

### Duty cycle correction factor calculation:

Number of transmissions within 100 ms is 80

Date: 23.SEP.2009 09:36:57

Transmission width is 196  $\mu$ s.

Date: 28.SEP.2009 11:34:18

Duty cycle factor calculation:  $20 \times \text{Log} \{ (80 \times 0.196 \text{ ms}) / 100 \text{ ms} \} = -16.093 \sim -16 \text{ dB}$

**Clause 15.247(a)(1) Frequency hopping systems**

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

**Test Results:** Pass

**Clause 15.247(a)(1)(iii) Frequency hopping systems operating in the 2400–2483.5 MHz band**

Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 s within a period of 0.4 s multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used

**Test Results:** Pass

**Number of Hopping Channels:**

Date: 23.SEP.2009 09:18:24

Total number of hopping channels is 79

## Time of Occupancy:

Date: 23.SEP.2009 09:28:51

Number of pulses within 2 s period is 21.

## Pulse width 197 µs

## Occupancy Time

### Limit:

0.4 seconds within a period of 0.4 s multiplied by the number of hopping channels employed, which is 0.4 s within the period of time  $0.4 \times 79 = 31.6$  s

### Measurement data:

Time of occupancy plots showing 21 hits per 2 s; therefore there would be  $16 \times 21 = 336$  hits within 32 s

Total of Occupancy Time is therefore  $= 336 \times 0.197 \text{ ms} = 66.2 \text{ ms}$

**Clause 15.247(b)(1) Maximum peak output power of Frequency hopping systems operating in the 2400–2483.5 MHz band and 5725–5850 MHz band**

For frequency hopping systems operating in the 2400–2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725–5850 MHz band: 1 W. For all other frequency hopping systems in the 2400–2483.5 MHz band: 0.125 W.

**Clause 15.247(b)(4) Maximum peak output power**

The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

**Test Results:** Pass

**Peak Output Power:**

Frequency MHz	POP mW	POP dBm	POP Limit dBm	Margin dB	Ag dBi	EIRP dBm	EIRP Limit dB	Margin dB
2402	17.79	12.50	30.00	17.50	1.00	13.50	36.00	22.50
2441	17.10	12.33	30.00	17.67	1.00	13.33	36.00	22.67
2480	21.52	13.33	30.00	16.67	1.00	14.33	36.00	21.67

**Additional Observations:**

All Measurements were performed conducted using a peak detector with 2 MHz/3 MHz RBW/VBW.

The input voltage has been changed  $\pm 15$  % of nominal; no significant change in power reading was noticed.

---

**Clause 15.247(d) Radiated Emissions Not in Restricted Bands**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

**Test Results:** Pass

**Additional Observations:**

The Emissions measured at a distance of 3 m and the spectrum was searched from 30 MHz to 25 GHz. Measurements were performed using a Peak detector with 100 kHz RBW / 300 kHz VBW.

The EUT was measured on three orthogonal axis.

**No emissions were detected higher than 20 dB below the in-band emission measured with 100 kHz IF bandwidth.**
